BIOLOGICAL ACTIVITY OR INHIBITORS

Zingerone, a major component found in ginger root, has been known as anti-mutagenic and anti-carcinogenic activities that are often associated with its anti-oxidative and anti-inflammatory activities; zingerone has not only the antioxidant effect by constitutive suppression of ROS, but also anti-inflammatory effects by suppression of nuclear factor (NF)-kappaB activation in aged rat; zingerone treatment can suppress gene activation of pro-inflammatory enzymes, COX-2 and iNOS, which are upregulated with aging through

[1] endogenous antioxidant levels and scavenging of radiation-induced free radicals. Zingerone can inhibit biofilm formation and improve antibiofilm efficacy of ciprofloxacin against *Pseudomonas aeruginosa* PAO1, it could as potential phytotherapeutic agent which in future can be employed to formulate preventive strategies against biofilm

[4] NF-kappaB activation and IKK/MAPK signaling pathway.

Zingerone attenuates lipopolysaccharide-induced acute lung injury in mice.

Zingerone has the potential in mitigating radiation-induced mortality and cytogenetic damage, which may be attributed to inhibition radiation-induced decline in the

[3] associated infections caused by *P.aeruginosa*.

Zingerone can be recommended as a supplement to shrimp feed to increase growth, immunity, and disease resistance against the pathogen, *V.alginolyticus*, use of zingerone

[5] Zingerone appears to produce less lipolytic actions in adipocytes derived from the High
