### BIOLOGICAL ACTIVITY OR INHIBITORS

Berberine, a naturally occurring isoquinoline alkaloid, has been shown to possess anti-inflammatory and antitumor properties in some in vitro systems; berberine-induced apoptosis of human prostate cancer cells is mediated primarily through the caspase-dependent pathway, the effectiveness of berberine in checking the growth of androgen-insensitive, as well as androgen-sensitive, prostate cancer cells without affecting the growth of normal prostate epithelial cells indicates that it may be a promising candidate for prostate cancer therapy. [1]

Berberine has beneficial effects in the treatment of diabetes and obesity at least in part via stimulation of AMPK activity, can reduce body weight and cause a significant improvement in glucose tolerance without altering food intake in mice, downregulate the expression of genes involved in lipogenesis and upregulate those involved in energy expenditure [2]

Berberine can ameliorate  $\beta$ -amyloid pathology, gliosis, and cognitive impairment in an Alzheimer's disease transgenic mouse model.[3]

Berberine can suppress inflammatory agents-induced cytokine production in lung cells, the suppression of berberine on the cytokine production resulted from the inhibition of inhibitory  $\kappa$ B- $\alpha$  phosphorylation and degradation, suggests the potential role of berberine in the treatment of pulmonary inflammation. [4]

Berberine down-regulates u-PA, MMP-2 and -9 expressions in SCC-4 cells through the FAK, IKK and NF-kappaB mediated pathways and a novel function of berberine

Berberine has anti-proliferation activity against human esophageal cancer cell lines [6]
