BIOLOGICAL ACTIVITY OR INHIBITORS

Oxyresveratrol(OXY) shows potent inhibitory effect with an IC(50) value of 1.2 microm on mushroom tyrosinase activity, which is 32-fold stronger inhibition than kojic acid, a depigmenting agent used as the cosmetic material with skin-whitening effect and the medical agent for hyperpigmentation disorders; the depigmenting effect of oxyresveratrol works through reversible inhibition of tyrosinase activity rather than suppression of the expression and synthesis of the enzyme. [1]

Oxyresveratrol is a more effective scavenger for 2,2-diphenyl-1-picryl-hydrazyl (DPPH, 100 microM) used as a general free radical model, compared to resveratrol (RES) or trans-4-hydroxystilbene (IC(50)=28.9, 38.5, and 39.6 microM, respectively), OXY displayed a generally lower cytotoxicity than RES; the radical and ROS scavenging properties, as well as the lower cytotoxicity towards microglia and the known good water solubility suggest OXY as a potential protectant against reactive oxygen and nitrogen [2]

Oxyresveratrol has neuroprotective effect, it can inhibit the apoptotic cell death in transient [3]

Oxyresveratrol, a dietary phenolic compound, as a potential nutritional candidate for protection against neurodegeneration in Parkinson disease. [4]

Oxyresveratrol exhibits the inhibitory activity at the early and late phase of viral replication and inhibited the viral replication with pretreatment in one-step growth assay of HSV-1 and HSV-2, it inhibits late protein synthesis at 30microg/ml; the combination of oxyresveratrol and acyclovir (ACV) produced synergistic anti-HSV-1 effect, topical application of 30% oxyresveratrol ointment five times daily significantly delayed the development of skin [4]

Oxyresveratrol as an antibrowning agent for cloudy apple juices and fresh-cut apples.
