BIOLOGICAL ACTIVITY OR INHIBITORS

Salvianolic acids(SA) are the most abundant water-soluble compounds extracted from Radix Salvia miltiorrhiza (Danshen), have multiple mechanisms for cardiovascular protection; the cardiovascular protection of SA is not only because salvianolic acids act as reactive oxygen species scavengers, but also due to the reduction of leukocyte-endothelial adherence, inhibition of inflammation and metalloproteinases expression from aortic smooth muscle cells, and indirect regulation of immune function; competitive binding of salvianolic acids to target proteins to interrupt protein-protein interactions has also been found to be a mechanism of cardiovascular protection by salvianolic acids. [1] In vitro, Salvianolic acids inhibited significantly the platelet aggregation induced by collagen, ADP, and AA with IC50 values of 0.197, 2.22 and 3.29 x 10(3) mg/l, respectively; in vivo, doses of SA at 6 and 10 mg/kg body wt. inhibited significantly the platelet aggregation induced by collagen, and SA at 10 mg/kg body wt. inhibited remarkably platelet aggregation induced by ADP; suggest that SA could improve rCBF in the ischemic hemisphere and inhibit platelet aggregation in rats.
