The root of Glycyrrhiza glabra L.

BIOLOGICAL ACTIVITY OR INHIBITORS

Liquiritin, a flavone compound derived from *Glycyrrhiza uralensis*, it can effectively reverse alteration in immobility time and sucrose consumption, can increase SOD activity, inhibit lipid peroxidation, and lessen production of MDA, demonstrates that a potential antidepressant-like effect of liquiritin treatment on chronic variable stress can induce depression model rats, which might be related to defense of liquiritin against oxidative [1]

Liquiritin has neuroprotective effect against focal cerebral ischemia/reperfusion in mice via its antioxidant and antiapoptosis properties, it may be a potential agent against cerebral stress. [2]

I/R injury in mice. [2]

Liquiritin significantly promotes the neurite outgrowth stimulated by NGF in PC12 cells in dose dependant manners whereas the liquiritin alone did not induce neurite outgrowth, and it has the neurotrophic effect on the overexpression of neural related genes such as neurogenin 3, neurofibromatosis 1, notch gene homolog 2, neuromedin U receptor 2 and neurotrophin 5; liquiritin also modulate ERK and AKT/GSK-3 β dependent pathways to protect against glutamate Alzheimer's disease or Parkinson's disease [2,3]

Liquiritin can attenuate advanced glycation end products-induced endothelial dysfunction via RAGE/NF- κ B pathway in human umbilical vein endothelial cells, it may be a promising agent for the treatment of vasculopathy in diabetic patients.[5]
