BIOLOGICAL ACTIVITY OR INHIBITORS

Hispidulin, a benzodiazepine receptor ligand with positive allosteric properties, can

[1] traverse the blood–brain barrier and exhibit anticonvulsive effects. Hispidulin possesses anti-inflammatory and anti-oxidative activities, it can inhibit vascular endothelial growth factor (VEGF)-induced cell migration, invasion, and capillary-like structure formation of HUVECs in a dose-dependent manner; it can suppress VEGF-induced microvessel sprouting of rat aortic rings and corneal neovascularization in C57/BL6 mice; indicates that hispidulin targets the VEGF receptor 2-mediated PI3K/Akt/mTOR signaling pathway in endothelial cells, leading to the suppression of

[2] potential to be a chemopreventive and therapeutic agent against human GBM.

Hispidulin has protection on bromobenzene-induced hepatotoxicity in mice, it has inhibition of liver injury and lipid peroxidation, the hepatoprotective effects can be related to pancreatic tumor growth and angiogenesis.

Hispidulin can potently inhibit human glioblastoma multiforme(GBM) cells through activation of AMP-activated protein kinase (AMPK), demonstrates that hispidulin has the

different from that of theophylline or PGE1.

Hispidulin can attenuate osteoclastogenesis and bone resorption, it could as a potent inhibitor of osteoclastogenesis and bone resorption and provides evidence for its

[7]

Hispidulin exerts anti-osteoporotic and bone resorption attenuating effects via activating therapeutic potential to treat diseases involving abnormal bone lysis.

[8]

Hispidulin can ameliorate high glucose-mediated endothelial dysfunction via inhibiting PKC β II-associated NLRP3 inflammasome activation and NF- κ B signaling, indicates the beneficial effects of hispidulin on the improvement of endothelial dysfunction and explains its potential application in the prevention and treatment of diabetic vascular the AMPK signaling pathway in ovariectomized mice.
