BIOLOGICAL ACTIVITY OR INHIBITORS

Vanillin, the principle flavour component of vanilla, has antimicrobial activity against *Escherichia coli*, *Lactobacillus plantarum* and *Listeria innocua*, it is primarily a membrane-active compound, resulting in the dissipation of ion gradients and the inhibition of respiration, the extent to which is species-specific, these effects initially do not halt the production of ATP; understanding the mode of action of natural antimicrobials may facilitate their application as natural food preservatives, particularly for their potential use in preservation systems employing multiple hurdles. [1]

Vanillin, a food additive, has been evaluated as a potential agent to treat sickle cell anemia.[2]

Vanillin, an acknowledged antimutagen, anticlastogen and anticarcinogen, it is an inhibitor of non-homologous DNA end-joining (NHEJ).[3]

Vanillin has been shown to suppress cancer cell migration and metastasis in a mouse model, the inhibition of PI3K activity is a mechanism underlying the inhibitory effect on cancer cell migration, and the presence of an aldehyde or ketone group in the vanillin structure was important for this inhibition; vanillin also inhibits angiogenesis. [4]

Vanillin has protective effect on radiation-induced micronuclei and chromosomal aberrations in V79 cells, it is an anticlastogenic agent.[5]
