### BIOLOGICAL ACTIVITY OR INHIBITORS

Silymarin (SIL), a standardized plant extract containing about 60% polyphenole silibinin, is used as a hepatoprotective agent, it retards collagen accumulation in early and advanced biliary fibrosis secondary to complete bile duct obliteration in rats, it also may play a role in the therapy of (alcoholic) liver cirrhosis.[1,2]

Silymarin modulates imbalance between cell survival and apoptosis through interference with the expressions of cell cycle regulators and proteins involved in apoptosis; it also shows anti-inflammatory as well as anti-metastatic activity; it has the protective effects in various tissues, suggest a clinical application in cancer patients as an adjunct to established therapies, to prevent or reduce chemotherapy as well as radiotherapy-induced toxicity.[3]

Silymarin possesses antioxidant, anti-inflammatory and immunomodulatory properties which may lead to the prevention of skin cancer in in vivo animal models, suggests that it is a promising chemopreventive and pharmacologically safe agent which can be exploited or tested against skin cancer in human system, moreover, it may favorably supplement sunscreen protection and provide additional anti-photocarcinogenic protection.[4]

Silymarin induces apoptosis primarily through a p53-dependent pathway involving Bcl-2/Bax, cytochrome c release, and caspase activation.[5]

Silymarin and silibinin cause G1 and G2-M cell cycle arrest via distinct circuitries in human prostate cancer PC3 cells.[6]
