BIOLOGICAL ACTIVITY OR INHIBITORS

Ginsenoside Rb3 has protective effects on oxygen and glucose deprivation-induced ischemic injury in PC12 cells.^[1]

Ginsenoside Rb3 possesses the effect against isoproterenol-induced myocardial injury and heart function impairment, and that the mechanism of pharmacological action was related to the antioxidant activity of ginsenoside Rb3 at least in part.^[2]

Ginsenoside Rb3 is extracted from the plant *Panax ginseng* and plays important roles in cardiovascular diseases, including myocardial ischemia-reperfusion (I/R) injury, the protective effect of ginsenoside Rb3 on the OGD-Rep injury is attributed to the inhibition of JNK-mediated NF-κB activation, suggesting that ginsenoside Rb3 has the potential to serve as a novel therapeutic agent for myocardial I/R injury.^[3]

Ginsenoside Rb3 may have antidepressant-like effects, brain-derived neurotrophic factor and the monoamine neurotransmitters 5-hydroxytryptamine, dopamine, and norepinephrine are involved in ginsenoside Rb3's antidepressant-like effects. ^[4]

Ginsenoside Rb3 significantly attenuates the changes of creatine kinase activity and lactate dehydrogenase activity.
^[5]

Ginsenoside Rb3 can exert a neuroprotective role on hippocampal neurons, a role which was partly mediated by the facilitation of Ca²⁺-dependent deactivation of NMDA receptors, and the resultant reduction of intracellular free Ca²⁺ level.^[6]

Ginsenoside Rb3 reduces fasting blood glucose level, food intake, water intake, improved oral glucose tolerance, and repaired injured pancreas tissues of alloxan-induced diabetic mice, suggests that ginsenoside possesses the potential of the clinical use in preventing and treating diabetes.^[7]
