BIOLOGICAL ACTIVITY OR INHIBITORS

Ginsenoside Re, a main phytosterol of Panax ginseng, inhibits Ca²⁺ accumulation in mitochondria during cardiac ischemia/reperfusion, which is attributable to nitric oxide (NO)-induced Ca²⁺ channel inhibition and K⁺ channel activation in cardiac myocytes, acts as a specific agonist for the nongenomic pathway of sex steroid receptors, and NO released from activated eNOS underlies cardiac K⁺ channel activation and protection against ischemia-reperfusion injury, G-Re also exerts antiischemic effect and induces angiogenic regeneration.^[1,2]

Ginsenoside Re has anti-diabetic and anti-hyperlipidemic activities, can improve hyperglycemia and hyperlipidemia through activation of AMPK, and confer beneficial effects on type 2 diabetic patients with insulin resistance and dyslipidemia.^[3]

Ginsenoside Re can improve the cognition of streptozotocin-induced diabetic rats, the mechanism is by its anti-inflammation and antioxidation; glycemic control benefits the attenuation of diabetes-associated cognitive decline.^[4]

Ginsenoside Re can hyperpolarize HCAECs, and this effect can be reversed by apamin, suggests ginsenoside Re increases HCAEC outward current via SKCa channel activation, and NSC channel is not involved.^[5]

Ginsenoside Re increases the proliferation of CD4⁺ T cells with decreases cell death, and enhances viability of CD4⁺T cells through the regulation of IFN- γ -dependent autophagy activity.^[6]

Ginsenoside Re exhibits potent neuroprotective effects against neuroinflammation in a murine model of ALS, ginsenoside Re treatment can reduce the loss of motor neurons and active-microglia-related expression of Iba-1 in the spinal cord of symptom.^[7]
