SOURCE

The rhizomes of *Curcuma zedoaria* (Berg.) Rosc.

BIOLOGICAL ACTIVITY OR INHIBITORS

Curdione, isolated from the rhizome of *Curcuma zedoaria*, has the inhibitory effect on the production of prostaglandin E2 in lipopolysaccharide (LPS)-stimulated mouse macrophage RAW 264.7 cells in a concentration-dependent manner (IC50 = 1.1 µM); the suppression of cyclooxygenase-2 (COX-2) mRNA expression is, at least in part, involved in this inhibitory activity of curdione; the inhibitors of prostaglandin biosynthetic enzyme cyclooxygenase (COX) have played a role of anti-inflammatory and cancer chemopreventive agents; suggests that curdione may have anti-inflammatory and cancer chemopreventive activities.^[1]

Curdione can induce the apoptosis of the human breast cancer cell line MCF-7, and block the cells at G1/G0 phase, thereby inhibiting the proliferation of MCF-7 cells; and both mitochondrial pathway and death receptor pathway participate in the process to induce the apoptosis.^[2]

Curdione shows significant anti-platelet aggregation and antithrombotic activities, the inhibitory mechanism of curdione on platelet aggregation may increase cAMP levels and subsequently inhibit intracellular Ca²⁺ mobilization.^[3]

Curdione plays an important role in the CYP3A4 inhibitory activity of *C. aromatica* and curdione might inhibit the activity by accelerating the degradation of CYP3A4.^[4]
