BIOLOGICAL ACTIVITY OR INHIBITORS

Ginsenoside-Ro, an oleanane-type saponin, has anti-inflammatory activity, it (10, 50, and 200 mg/kg, p.o.) inhibits an increase in vascular permeability in mice induced by acetic acid and reduces an acute paw edema in rats induced by compound 48/80 or carrageenin; it is effective in hypercoagulable state, increase of connective tissue in the artery and calcium effluence from the bone in adjuvant-induced arthritic rats.^[1]

Ginsenoside Ro inhibits the increase of connective tissue in the liver of CCl₄-induced chronic hepatic rats, it shows a stronger inhibitory effect on the GalN-induced acute hepatic model than those of the aglycone of ginsenoside Ro, oleanolic acid, or glycyrrhizic acid and its aglycone, glycyrrhetic acid.^[2]

Ginsenoside Ro shows inhibitory activity against 5 α R with IC₅₀ values of 259.4 μ m; it (0.265mg/mouse) to shaved skin inhibited hair re-growth suppression after shaving in the testosterone-treated C57BL/6 mice; suggests that ginsenoside Ro enhances in vivo hair re-growth based on their inhibitory activity against 5 α R in the androgenetic alopecia model.^[3]

Ginsenoside-Ro increases the production and expression of Th2 cytokine IL-4 and decreases the production and expression of Th1 cytokine IFN- γ in Con A-induced murine splenocytes at concentrations of 2-10 μ mol·L⁻¹, it shows immunomodulatory effects by regulating the production and expression of Th1/Th2 cytokines in murine splenocytes.^[4]

Ginsenoside Ro exerts anti-apoptosis and anti-inflammation in IL-1 β -induced rat chondrocytes, which might be related to NF- κ B signal pathway, it might be a potential novel drug for the treatment of osteoarthritis.^[5]

Ginsenoside Ro has antioxidative properties against UV-B-induced oxidative stress in human dermal fibroblasts, it possesses a potential skin anti-photoaging property against UV-B radiation in fibroblasts.^[6]
