BIOLOGICAL ACTIVITY OR INHIBITORS

Wedelolactone, a natural compound that inhibits LPS-induced caspase-11 expression in cultured cells by inhibiting NF-kappaB-mediated transcription, it is an inhibitor of IKK, a kinase critical for activation of NF-kappaB by mediating phosphorylation and degradation of IkappaBalpha.[1]

Wedelolactone, para-bromophenacyl bromide and heparin are antagonists of these two phospholipase A2 myotoxins, and that antagonism by the first two compounds may be due to a more specific interaction with these proteins than that by the latter.[2]

Wedelolactone is a potent Î2-arrestin-biased G protein-coupled receptor-35 (GPR35) agonist, GPR35 has been shown to be a target of the asthma drugs cromolyn disodium and nedocromil sodium, suggests that certain anti-inflammatory phytochemicals including gallic acid and wedelolactone may modulate inflammatory allergic action via their agonism at GPR35, GPR35 may represent a target for the treatment of allergic disorders including asthma. [3]

Wedelolactone inhibits adipogenic differentiation through ERK pathway and suggest a novel inhibitory effect of wedelolactone on adipogenic differentiation in human adipose tissue-derived mesenchymal stem cells (hAMSCs). [4]

Wedelolactone selectivity induces caspase-dependent apoptosis in prostate cancer cells via a novel mechanism involving inhibition of PKCε without affecting Akt and suggest that it may emerge as a novel therapeutic agent against clinical prostate cancer in human.[5]

Wedelolactone exhibits anti-fibrotic effects, it can significantly inhibit the activation of LX-2 cells, the underlying mechanisms of which included inducing Bcl-2 family involved apoptosis, up-regulating phosphorylated status of ERK and JNK expressions, and inhibiting nuclear factor-κB (NF-κB) mediated activity, it may present as a useful tool for the prevention and treatment of hepatic fibrosis.[6]

Wedelolactone can inhibit breast cancer-mediated osteoclastogenesis, it inhibits the upregulation of osteoclasts stimulated by MDA62MB62231 breast cancer cells, regulates breast cancer-enhanced interaction of osteoblasts and osteoclasts by decreasing M-CSF expression in MDA62MB62231-stimulated osteoblasts; thus, suggests that wedelolactone

may be a potential natural agent for preventing and treating bone destruction in patients with bone metastasis due to breast cancer.[7]
