BIOLOGICAL ACTIVITY OR INHIBITORS

Amentoflavone, a biflavonoid with antiinflammatory activity, inhibits NF- κ B/DNA binding activity potently along with inhibition of degradation of I κ B α and NF- κ B translocation into nucleus in TNF α -activated A549 cells.^[1]

Amentoflavone has the inhibition of LPS-induced NO formation, is due to its inhibition of NF-kappaB by blocking degradation, which may be the mechanistic basis of the anti-inflammatory effects of amentoflavone.^[2]

Amentoflavone has been shown to inhibit tumor metastasis in vivo, amentoflavone treatment reduces experimental tumor metastasis and suggest that such an action is associated with attenuation of tumor invasion, proliferation and angiogenesis.^[3]

Amentoflavone has been shown to inhibit tumor metastasis in vivo, inhibits experimental tumor metastasis through a regulatory mechanism involving MMP-2, MMP-9, prolyl hydroxylase, lysyl oxidase, VEGF, ERK-1, ERK-2, STAT-1, NM23 and cytokines in lung tissues of C57BL/6 mice.^[4]

Amentoflavone and its derivatives as novel natural inhibitors of human Cathepsin B(CatB), CatB is a member of the papain superfamily of cysteine proteases and has been implicated in the pathology of numerous diseases, including arthritis and cancer. ^[5]

Amentoflavone induces breast cancer apoptosis through blockade of fatty acid synthesis.^[6]

Amentoflavone exhibits potent antifungal activity against several pathogenic fungal strains but has a very low hemolytic effect on human erythrocytes, it induces the accumulation of intracellular trehalose on *C. albicans* as a stress response to the drug, and disrupts the dimorphic transition that forms pseudo-hyphae during pathogenesis, it has great potential to be a lead compound for the development of antifungal agents.^[7]
