BIOLOGICAL ACTIVITY OR INHIBITORS

Calycosin-7-O- β -d-glucoside(CG) treatment can significantly reduce infarct volume, histological damage and BBB permeability in the in vivo MCAO ischemia-reperfusion rat model; inhibit the expression and activities of MMPs, and secure the expression of cav-1 and tight junction proteins in the microvessels isolated from ischemic rat cortex; scavenge NO, inhibit the activities of MMP-2 and MMP-9, and attenuate cell death in the in vitro cultured brain microvascular endothelial cells under OGD condition; thus CG could protect BBB integrity in experimental cerebral ischemia-reperfusion injury via regulating NO/cav-1/MMPs pathway.[1]

Calycosin-7-O- β -D-glucoside can promote oxidative stress-induced cytoskeleton reorganization through integrin-linked kinase signaling pathway in vascular endothelial cells.[2]

Calycosin-7-O- β -d-glucoside attenuates ischemia-reperfusion injury in vivo via activation of the PI3K/Akt pathway. [3]

Calycosin-7-O- β -D-glucoside has effects on cell apoptosis in cervical cancer HeLa cells and expression of Bcl-2/Bax.[4]
