BIOLOGICAL ACTIVITY OR INHIBITORS

Berberine hydrochloride (berberine), a natural plant alkaloid derived from Chinese herbal medicine, is characterized by diverse pharmacological effects, such as anticancer and lower elevated blood glucose, it can prevent adhesion by downregulating ICAM-1 and reduce inflammation by inhibiting the TAK1/JNK and TAK1/NF- κ B signaling after abdominal surgery, which brings out a good therapeutic approach for the development of clinical application for postoperative abdominal adhesion and inflammation.[1]

Berberine hydrochloride is a conventional component in Chinese medicine, and is characterized by a diversity of pharmacological effects, has anticancer activity and

the chance of regulating glucose and lipid metabolism in cancer cells showing more potential than ever. [2]

Berberine hydrochloride is an alkaloid with little or no fluorescence in water, in sodium dodecylsulfate solutions, the fluorescence intensity of this compound is enhanced several folds by ion-pairing with the anion of the surfactant. [3]

Berberine hydrochloride can significantly attenuate neutrophil infiltration, suppress myeloperoxidase activity, decrease NO, TNF- α and IL-1 β production, inhibits the phosphorylation of the NF- κ B p65 subunit and the degradation of its inhibitor, I κ B α , thus, exerts potent anti-inflammatory effects on LPS-induced mouse endometritis and may be a potential therapeutic agent for endometritis.[4]

Berberine hydrochloride has significant reductive ability and radicals scavenging effects, especially on ABTS, hydroxyl radicals and DPPH radicals.[5]

Sensory evaluation of the taste of berberine hydrochloride could be used an Electronic Tongue.[6]

Berberine hydrochloride has antifungi activity.[7]
