BIOLOGICAL ACTIVITY OR INHIBITORS

Sesamin, a lignan from sesame oil, sesamin feeding inhibits enhanced vascular O₂- production in DOCA-salt hypertensive rats and that the antioxidative action of sesamin may contribute to its antihypertensive activity.[1]

Sesamin has antioxidative activity, it protects β -cells from damage caused by Advanced glycation end products (AGEs) through suppressing NADPH oxidase-mediated oxidative stress.[2]

Sesamin causes elevation of tissue tocopherol concentration in rats, strongly inhibits tocopherol metabolism by HepG2/C3A cells at 1.0 μ M, the results support a CYP3A-dependent mechanism of side chain metabolism of tocopherols to water-soluble carboxychromans, and provide the first evidence of a specific enzyme involved in vitamin E metabolism, suggests that sesamin increases tissue tocopherol concentration by inhibiting tocopherol catabolism. [3]

Chronic ingestion of vitamin E and sesamin attenuate both elevation in blood pressure, oxidative stress and thrombotic tendency, suggesting that these treatments might be beneficial in the prevention of hypertension and stroke.[4]

Sesamin is a potent and specific inhibitor of delta 5 desaturase in polyunsaturated fatty acid biosynthesis.[5]

Sesamin has anti-inflammatory properties, it attenuates intercellular cell adhesion molecule-1 expression in vitro in TNF- α -treated human aortic endothelial cells and in vivo in apolipoprotein-E-deficient mice, suggests that it may prevent the development of atherosclerosis and inflammatory responses.[6]

Sesamin induces significant neuroprotection, by ameliorating many signaling pathways activated/deactivated following cerebral ischemia in adult mouse.[7]

Sesamin, at the level of 100 mg/kg body weight, can prevent liver lipid accumulation by carbon tetrachloride in mice, indicates that sesamin and a related lignan compound have an ability to improve liver function.[8]

Sesamin possesses antihypertensive, cholesterol-lowering, lipid-lowering and anticancer activities, it can down-regulate cyclin D1 protein expression through the activation of proteasome degradation, the effect could be one of the mechanisms of the antiproliferative activity of this agent.[9]
