### BIOLOGICAL ACTIVITY OR INHIBITORS

Vitexin is a class of nature lignan compounds, whose action and anticancer effect is mediated by the mechanisms different from the classic lignans, vitexin-induced antitumor effect and cytotoxic activity is exerted through proapoptotic process, which is mediated by a decreased Bcl-2/Bax ratio and activation of caspases.[1]

Mung bean extract and its constituents vitexin and isovitexin have inhibitory effect on the formation of advanced glycation endproducts, the anti-glycation activities may mainly be due to their free radical scavenging capacity. [2]

Vitexin can be effectively used for the prevention of UV-induced adverse skin reactions such as free radical production and skin cell damage. [3]

Vitexin has spasmolytic effects, because it non-competitively inhibits Ach but not the Ca(2+) influx.[4]

Vitexin, an HIF-1alpha inhibitor, it has anti-metastatic potential in PC12 cells.[5]

Vitexin has anti-inflammatory and antinociceptive activities, it can inhibit inflammatory pain in mice by targeting TRPV1, oxidative stress, and cytokines.[6]

Vitexin exhibits significant protective effect against myocardial I/R injury in isolated rat heart, which is related to inhibition of the release of inflammatory cytokines and the apoptosis of cardiac muscle cell via up-regulating protein expression of Bcl-2 as well as down-regulating Bax and NF-κBp65.[7]

Vitexin has anticonvulsant effects in the brain, possibly through interaction at the benzodiazepine site of the γ-aminobutyric acid type A receptor complex. [8]

Vitexin has anti-depressant effects, the mechanism is mediated through an increase in catecholamine levels in the synaptic cleft as well as through interactions with the serotonergic 5-HT1A , noradrenergic α2 , and dopaminergic D1 , D2 , and D3 receptors.[9]
