BIOLOGICAL ACTIVITY OR INHIBITORS

Berberine, a naturally occurring isoquinoline alkaloid, has been shown to possess anti-inflammatory and antitumor properties in some in vitro systems; berberine-induced apoptosis of human prostate cancer cells is mediated primarily through the caspase-dependent pathway, the effectiveness of berberine in checking the growth of androgen-insensitive, as well as androgen-sensitive, prostate cancer cells without affecting the growth of normal prostate epithelial cells indicates that it may be a promising candidate for prostate cancer therapy.[1]

Berberine has beneficial effects in the treatment of diabetes and obesity at least in part via stimulation of AMPK activity, can reduce body weight and cause a significant improvement in glucose tolerance without altering food intake in mice, downregulate the expression of genes involved in lipogenesis and upregulate those involved in energy expenditure in adipose tissue and muscle, and activate AMP-activated protein kinase.[2]

Berberine can ameliorate β -amyloid pathology, gliosis, and cognitive impairment in an Alzheimer's disease transgenic mouse model.[3]

Berberine can suppress inflammatory agents-induced cytokine production in lung cells, the suppression of berberine on the cytokine production resulted from the inhibition of inhibitory κ B- α phosphorylation and degradation, suggests the potential role of berberine in the treatment of pulmonary inflammation.[4]

Berberine down-regulates u-PA, MMP-2 and -9 expressions in SCC-4 cells through the FAK, IKK and NF-kappaB mediated pathways and a novel function of berberine is to inhibit the invasive capacity of malignant cells.[5]

Berberine has anti-proliferation activity against human esophageal cancer cell lines.[6]
