BIOLOGICAL ACTIVITY OR INHIBITORS

Ginsenoside Rg2 suppresses the hepatic glucose production via AMPK-induced phosphorylation of GSK3 β and induction of SHP gene expression, suggests that it has therapeutic potential for type 2 diabetic patients.[1] Ginsenoside Rg2 inhibits nicotinic acetylcholine receptor-mediated Na⁺ influx and channel activity; it also inhibits the 5-HT-induced inward peak current (I_{5-HT}) in dose dependent and reversible manner, the half-inhibitory concentrations (IC₅₀) of ginsenoside Rg2 is 22.3 +/- 4.6 microM, suggests that it might regulate the 5-HT_{3A} receptors that are expressed in *Xenopus* oocytes.[2]

Ginsenoside Rg2 can reduce LPS-mediated THP-1 monocyte adhesion to HUVEC, in a concentration-dependent manner, it may provide direct vascular benefits with inhibition of leukocyte adhesion into vascular wall thereby providing protection against vascular inflammatory disease.[3]

Ginsenoside Rg2 protects cells against UVB-induced genotoxicity by increasing DNA repair, in possible association with modulation of protein levels involved in p53 signaling pathway.[4]

Ginsenoside Rg2 improves learning and memory through mechanisms related to anti-apoptosis in MID rats, indicates that it may represent a potential neurorestorative treatment strategy for vascular dementia or other ischemic insults.[5]

Ginsenoside Rg2 has protective effects against H₂O₂-induced injury and apoptosis in H9c2 cells.[6]
