## BIOLOGICAL ACTIVITY OR INHIBITORS

---

Astragaloside IV, a saponin isolated from *Astragalus membranaceus*, has been shown to protect the myocardium against ischemia/reperfusion injury, it also has beneficial effect in H/R-induced injury may be related to normalization of SR Ca<sup>2+</sup> pump expression and, thus, it may prevent the depression in SR Ca<sup>2+</sup> handling.[1]

Astragaloside IV synergizes with ferulic acid to inhibit renal tubulointerstitial fibrosis in rats with obstructive nephropathy.[2]

Astragaloside IV attenuates glycated albumin-induced epithelial-to-mesenchymal transition by inhibiting oxidative stress in renal proximal tubular cells.[3]

Astragaloside IV can reduce phosphorylation of JNK and ERK1/2 induced by complement membranous attack complex, the mechanism of *Astragalus membranaceus* in the treatment of membranous nephropathy (MN) may be related to its attenuation of podocyte injury through regulation of cytoskeleton and mitogen activated protein kinase. [4] Astragaloside IV can reduce blood pressure and triglyceride levels in fructose-fed rats and high dose of astragaloside IV also improves glucose tolerance and endothelium-dependent vasorelaxation, the mechanism is associated with increased levels of aortic NO<sub>x</sub> and cGMP and is abrogated by blockade of nitric oxide synthase with NG-nitro-L-arginine methyl ester (L-NAME), suggests that astragaloside IV may be useful in ameliorating food-induced metabolic syndrome.[5]

Astragaloside IV attenuates inflammatory cytokines by inhibiting TLR4/NF-κB signaling pathway in isoproterenol-induced myocardial hypertrophy, and attenuates Toll-like receptor 4 expression via NF-κB pathway under high glucose condition in mesenchymal stem cells.[6,7]

Astragaloside IV can inhibit adenovirus replication and apoptosis in A549 cells in vitro.[8] Astragaloside IV can inhibit doxorubicin-induced cardiomyocyte apoptosis mediated by

mitochondrial apoptotic pathway via activating the PI3K/Akt pathway.[9]
