BIOLOGICAL ACTIVITY OR INHIBITORS

1,2,3,4,6-Pentagalloylglucose and gallic acid from *Pistacia lentiscus* have antimutagenic and antioxidant activities.[1]

1,2,3,4,6-Penta-O-galloyl-beta-D-glucose (PGG) possesses potent anti-proliferative and anti-invasive effects, it also has inhibition of inducible nitric oxide synthase and cyclooxygenase-2 activity; suggests that PGG might be a candidate for developing anti-inflammatory and cancer chemopreventive agents.[2] 1,2,3,4,6-Penta-O-galloyl-

-beta-D-glucopyranose (beta-PGG), one of the components of tannic acid, as well as its natural anomer alpha-PGG possess activity; alpha-PGG, the more potent of the two anomers, reveal that inhibitors that block the insulin-mediated glucose transport, including one that inhibits the insulin receptor (IR), also completely abolish the glucose transport activated by alpha-PGG, alpha-PGG induces phosphorylation of the IR and Akt, activates PI 3-kinase, and stimulates membrane translocation of GLUT 4; suggest that PGG may serve as a model for the development of new types of anti-diabetic and anti-metabolic syndrome therapeutics. [3] 1,2,3,4,6-Penta- O-galloyl-β- d -glucose has vasodilatory and anti-inflammatory effects,

it dilates vascular smooth muscle and suppresses the vascular inflammatory process via endothelium-dependent nitric oxide (NO)/cGMP signaling.[4] 1,2,3,4,6-Penta-O-galloyl-beta-D-glucose can decrease the level of extra-cellular hepatitis B virus (HBV) (IC50, 1.0 microg/ml) in a dose-dependent manner, it also can reduce the HBsAg level by 25% at a concentration of 4 microg/ml; the gallate structure of PGG may play a critical role in the inhibition of anti-HBV activity, suggests that PGG could be a candidate for developing an anti-HBV agent.[5]

1,2,3,4,6-Penta-O-galloyl-β-D-glucose has anti-parasitic activity, displays an EC50 value of 67 μM, at least 6.6-fold more effective than the standard drug benznidazole against trypomastigote forms of *T. cruzi*.[6]
