BIOLOGICAL ACTIVITY OR INHIBITORS

Ginsenoside (G)-F1 is an enzymatic metabolite generated from G-Rg1, it has been reported to suppress platelet aggregation and to reduce gap junction-mediated intercellular communication, also as a novel anti-skin cancer drug with anti-proliferative and anti-migration features.[1]

Ginsenoside F1 significantly reduces ultraviolet-B-induced cell death by maintaining constant levels of Bcl-2 and protects HaCaT cells from apoptosis caused by ultraviolet B irradiation. [2]

Ginsenoside F1(GF1) has beneficial effects on skin, it reduces α -melanocyte-stimulating hormone-induced melanin secretion in B16F10 cell culture media by 60%, but does not suppress intracellular melanin levels, tyrosinase activity and expression; it primarily modulates the Rho family GTPases resulting in dendrite retraction, suggests that GF1 could act as a potent skin-whitening agent.[3]

Ginsenoside F1 has inhibitory effect of elastase and tyrosinase, indicates that ginsenoside F1 have a potential for industrial cosmetic materials.[4]
